Rarebooksclub.com, United States, 2012. Paperback. Book Condition: New. 246 x 189 mm. Language: English . Brand New Book ***** Print on Demand *****.This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1912 Excerpt: .water load. The water loads are thus transmitted by direct thrust, the layers not being bonded together, but left free to take up the deformation under the water load by sliding on one another. If the rock will not take the load at an angle of 45 the water face may be made flatter and longer, and the buttresses, always at right angles to it, steeper and shorter. The typical design is, however, that with a 45 slope. Every part of the dam is subject to the same stress except that the top layer of the buttress and the upper part of the arch ring may have, respectively a greater width and a greater thickness, the minimum in each case for the materials used. This adoption of a general stress, instead of one varying from nearly zero to some maximum, is an important element of economy. Comparing this dam with a mass dam, under certain conditions of site and costs of material, the following, for dams 162 ft. high, was found: --Mass dam, maximum pressure (Bouvier) 10 tons Masonry, per square foot. j 100 units. Thrust buttress dam, minimum arch thickness 6) feet, stress in arches 15 tons per square foot, 95 units, in the buttresses 10 tons per square foot.) Thrust buttress dam with a minimum arch /-. thickness of 4 feet. (The difference would be considerably greater if we made, for the mass dam, $p \sec^2 \theta = 10$, or even $p \sec^2 \dots$
