

Geological Survey Professional Paper Volume 1202

Filesize: 7.86 MB

Reviews

*This composed pdf is great. This can be for all those who statte that there was not a well worth looking at. I am just happy to explain how this is actually the finest pdf we have go through inside my own daily life and could be he greatest publication for ever.
(Conrad Heaney)*

GEOLOGICAL SURVEY PROFESSIONAL PAPER VOLUME 1202

Rarebooksclub.com, United States, 2012. Paperback. Book Condition: New. 246 x 189 mm. Language: English . Brand New Book ***** Print on Demand *****.This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. Excerpt: .over the crack were given by Pollard and Muller (1976). Superimposing the three solutions (fig. 27) gives the boundary conditions- $ay=S(x)=S_0+SSx+Sx$; $oxy=0$, for $xa, y=0$. These driving-stress distributions for a single isolated crack result in a suitable range of cross-sectional forms and allow considerable insight into dike dilation and the subtle effects of stress gradients. The results, which we obtain as straightforward analytical expressions, make these simplifications attractive. Defining the dimensionless variables $X=x/a$ and $D(X)2u_0/a$, the important equations for our purposes are: $2D(X)=C, (1-X^2)^{1/2} +c_2(i-x)h^2+x^2n_x/i-a-xi^2y,2$ The three terms on the right-hand side of equation 19/4 represent the contributions to the thickness of the crack from each of the three boundary conditions. The relative importance of these terms depends on the relative magnitudes of the three constants, C, C_2, C_j , which may be either positive or negative but together must give a positive or zero thickness. Negative values of thickness indicate interpenetration of the crack walls and thus are physically inadmissible. As before, we determine values of the constants $C_v C_2$, and C_3 from field data on intrusive forms, using the method of multiple linear regression. The linear model is represented by where T , is the measured half-thickness normalized by the measured half-width, F_u, F_{2i} , and F_{3i} are the postulated functions of X from equation 19/4, X is the distance along the N. 56 E. line measured from the dike center and normalized by the half-width, d , is the deviation of the measured from the postulated...
